

Project Team: Prank Azaria
Project Title: Hinder

Description: Everyone has a group of friends they love to mess with. Hinder is a shared social network to shoot pranks at your friends, get pranked by them and rate the best goofs. When you log in you are required to sit through all your pranks before you can send any. The longer you take between logins, the more annoying it'll be to do so. :-)

We will have a multi-page site with a sign up, login, main page, send prank, and profile pages.

The database will store the users, login info, their group memberships and a record of the pranks. There will be a few pre-defined categories and will grow from there.

Our GET routes will populate user profiles and the main pranks page. The POST routes will allow new users and groups as well as handle the creation of new pranks.

The main page will show pending and previous pranks and allow members to vote on their favorites.

We will use a graphing plugin (like Chart.js or Raphael) to visualize the information in the database to show popular pranks and highest ranked Prankers.

===

Bonuses:

We hope to use handlebars to template the pages.

We will experiment with an authentication method for users.

We hope to populate a few prank categories from know fun web sources like Giphy and the Least Favorite Songs database.

Lastly we would like to add a notification engine that can send text alerts to users with a "current waiting pranks" count daily.
